

CLEAN COPY OF ALL PENDING CLAIMS

1. (Thrice Amended) An interventional device, comprising:
a sonoluminescent light module for placement inside a body, the module comprising
 - (i) an acoustic transducer comprising a piezoelectric element and a wave matching layer for generating sound waves;
 - (ii) a housing enclosing an acoustic conducting medium, the acoustic conducting medium positioned in a pathway of the sound waves generated by the acoustic transducer, at least a portion of the housing being optically transparent; and
 - (iii) a lens for focusing the sound waves generated by the acoustic transducer in the acoustic conducting medium, whereby sonoluminescent light is generated.
2. (Cancelled)
3. (Cancelled).
4. (Amended) The interventional device of claim 1 wherein the lens is disposed between the acoustic transducer and the acoustic conducting medium.
5. (Amended) The interventional device of claim 1 wherein a distal end of the housing is shaped to provide reflection and concentration of sound waves in the acoustic conducting medium.
6. (Amended) The interventional device of claim 1 wherein a distal end of the housing is open to focus sound waves in the tissue.

7. (Amended) The interventional device of claim 1 wherein the acoustic conducting medium comprises water.
8. (Amended) The interventional device of claim 1 wherein the acoustic conducting medium comprises a solid substance or target on which sonoluminescent effect can be observed.
9. The interventional device of claim 3 wherein the piezoelectric material comprises lead zirconate-titanate.
10. The interventional device of claim 1 wherein the sonoluminescent light module is disposed near a distal end of the interventional device.
11. The interventional device of claim 10 further comprising a pulse generator in communication with the sonoluminescent light module through electrical conduits positioned inside the interventional device.
12. (Amended) The interventional device of claim 1 wherein the sonoluminescent light module is disposed near a distal end of the interventional device and the distal end of the interventional device performs as the housing.
13. (Cancelled)
14. (Amended) The interventional device of claim 1 wherein a position of the light module inside the interventional device is adjustable.

15. The interventional device of claim 10 wherein the interventional device has an optically transparent window comprising a material selected to transmit light having a predetermined wavelength.

16. (Cancelled)

17. (Amended) The interventional device of claim 1 wherein the sonoluminescent light module is capable of generating x-ray.

18. (Cancelled)

19. (Cancelled)

20. (Twice Amended) An interventional device, comprising:
a distal portion comprising an arc lamp for placement inside a body;
a proximal end connected to an energy source; and
a middle elongated portion that is at least partly inserted inside the body, comprising a signal conduit that electronically connects the energy source and the arc lamp.

21. The interventional device of claim 20 wherein the arc lamp comprises:
a housing, and
a first and a second electrode positioned inside the housing and in relation to each other to strike an arc.

22. The interventional device of claim 21 wherein the first electrode has a hemisphere shape and is coated with a metal.

23. The interventional device of claim 21 wherein the second electrode is formed on an inner surface of the housing by flash metallization.
24. The interventional device of claim 21 wherein the first and the second electrode are sealed inside the housing with sintered metal and a seal material that yields under high pressure.
25. The interventional device of claim 24 wherein the sintered metal comprises copper wool.
26. (Amended) The interventional device of claim 21 wherein a distal end of the housing is dome shaped for collecting and redirecting light generated by the arc lamp.
27. The interventional device of claim 21 wherein a material for the housing comprises quartz.
28. The interventional device of claim 21 further comprising a feedback system and a light guide disposed adjacent a housing wall for supplying light output to a feedback system.
29. (Amended) The interventional device of claim 20 wherein the interventional device is selected from the group consisting of a catheter, an endoscope, a guide wire, a needle, and an introducer.
30. The interventional device of claim 21 wherein the distal end of the interventional device performs as the housing.

31. (Cancelled)

32. (Twice Amended) An interventional device, comprising:

a distal portion comprising a fluorescent light source for placement inside a body;
a proximal end connected to an energy source; and
a middle elongated portion that is at least partly inserted inside the body, comprising a signal conduit that electronically connects the energy source and the fluorescent light source.

33. The interventional device of claim 32 wherein the fluorescent light source comprises a flash tube coated with a phosphorescent or fluorescing material.

34. The interventional device of claim 32 wherein the fluorescent light source comprises an equipotential flash tube shaped to discharge uniformly.

35. The interventional device of claim 34 wherein the fluorescent light source further comprises a dielectric material surrounding the flash tube and a pair of electrodes disposed at opposite sides of the dielectric material.

36. (Amended) The interventional device of claim 32 wherein the interventional device is selected from the group consisting of a catheter, an endoscope, a guide wire, a needle, and an introducer.

37. (Amended) The interventional device of claim 32 comprising a balloon catheter having a polymeric stent placed on an external surface of a balloon portion.

38. The interventional device of claim 37 wherein the polymeric stent becomes hardened when exposed to radiation generated by the fluorescent light source.

39. The interventional device of claim 38 wherein the polymeric stent comprises a ultraviolet curable epoxy or adhesive material.

40. The interventional device of claim 32 wherein the fluorescent light source comprises:
a Gunn-effect diode for generating radio-frequency energy;
a dielectric resonator disposed adjacent the diode; and
a gas tube comprising a gaseous substance that fluoresce when subjected to RF energy.

41. (Twice Amended) An interventional device, comprising:

a distal portion comprising a spark gap module for placement inside a body;
a proximal end connected to an energy source; and
a middle elongated portion that is at least partly inserted inside the body, comprising a signal conduit that electronically connects the energy source and the spark gap module.

42. The interventional device of claim 41 wherein the spark gap comprises two electrodes positioned in relation to each other for generating a spark across a gap between the two electrodes.

43. The interventional device of claim 42 wherein the two electrodes are sealed in a transparent housing.

44. The interventional device of claim 43 further comprising a filter disposed at a distal end of the housing for enhancing a desired light output.

45. (Cancelled)

46. (Cancelled)

47. (Twice Amended) An interventional device, comprising:

a distal portion comprising an incandescent lamp for placement inside a body and for generating short duration high intensity light waves;

a proximal end connected to an energy source; and

a middle elongated portion that is at least partly inserted inside the body, comprising a signal conduit that electronically connects the energy source and the incandescent lamp.

48. The interventional device of claim 47 wherein short duration comprises duration of less than 100 milliseconds.

49. The interventional device of claim 47 wherein the incandescent lamp comprises a housing, a pair of electrodes placed inside the housing and a filament connecting the pair of electrodes.

50. The interventional device of claim 49 wherein the filament comprises an oxidizing filament and the housing is filled with a selected gas for generating light having a pre-determined color.

51. (Cancelled)

52. The interventional device of claim 41, wherein the interventional device is selected from the group consisting of a catheter, an endoscope, a guide wire, a needle, and an introducer.

53. The interventional device of claim 47, wherein the interventional device is selected from the group consisting of a catheter, an endoscope, a guide wire, a needle, and an introducer.

54. (New) An interventional device comprising:

a thin, elongated member configured for insertion into a mammalian body, the member comprising a distal tip; and

a sonoluminescent light module associated with the elongated member, the sonoluminescent light module configured to acoustically generate a light inside the body, following insertion of at least the tip into the body.

55. (New) The device of claim 54, wherein the member comprises a flexible catheter.

56. (New) The device of claim 54, wherein the sonoluminescent light module is disposed within the elongated member.

57. (New) The device of claim 54, wherein the sonoluminescent light module comprises an acoustic transducer that generates sound waves, a housing that contains an acoustic conducting medium, and a lens that focuses the sound waves to produce the light.

58. (New) The device of claim 57, wherein the acoustic transducer comprises a piezoelectric element and a wave matching layer.

59. (New) The device of claim 56, wherein the sonoluminescent light module comprises an acoustic transducer that generates sound waves, an acoustic conducting medium, and a lens that focuses the sound waves to produce the light, the acoustic transducer, the medium, and the lens all being disposed within the elongated member.
